for Automotive

## Drive | Image for Automotive

Nowadays, companies in the automotive industry, such as car dealerships and dealership chains, do more than buy or sell used and new cars. They also offer their customers a variety of services such as repair and maintenance or financing and insurance. The associated number of receipts for these services, certificates, invoices, order confirmations, etc. must be organized on a daily basis and archived in the appropriate customer files for access by the employees who need them. This enables customer-specific information to be used at all of the car dealership's locations so employees can respond to customer's requests and needs without delay.

## Drive | Image Functionality

Drive | Image software let companies in the automotive industry digitize any type of document more efficiently. Its intuitive user-interface helps companies save time and money by reducing the amount of time employees spend at scanning device. Paper documents are placed in the input compartment of the multifunction device. An appropriate scan profile is selected, for example the transfer to a document management system, such as Drive | DM. Content from the database can be retrieved from the device display and used to accurately process the new documents. With the touch of a button, the documents are automatically transferred to selected destination. During the scanning process, image cleanup is performed, and a searchable PDF is created. At the same time, pre-defined settings allow sending the scanned documents to other recipients by fax or email. The file recipient can easily be selected via a database connection or the Outlook address book.

## Advantages

- **Complete all processes with the touch of a button** - Digitize, archive, and forward documents with a single touch of a button, and take advantage of various connectivity options in a single workflow.
- **Enjoy a high degree of usability** - Employees get all the advantages of an intuitive interface without the need for lengthy seminars and training; most users don't even realize they are working with scanning software.
- **Manage devices centrally** - All scanning devices are managed centrally by the administrator - the software is installed once on the server instead of on many local workstations, so configurations can be deployed on all devices at the same time.
- **Get control of your data** - With Drive | Image software, you will put an end to unorganized files and stacks of paper so you can focus on what really matters. Once processed, paper documents can be stored outside the organization at low cost, while you work with quickly available, easy to handle digital copies.

## Example

Michael works as a salesman for a car dealership. After a new care sale, once all relevant documents are available in paper format, he scans them via the car dealership's multifunction device. He places the documents in the scanner's input compartment and selects one of the profiles that are preset on the device. In this case, he selects the profile "ECM," which will scan the document and store it into the car dealership's ECM, or Document Management System. Within this profile, there may be a variety of different scan profiles, for example for new cars, used cars or customer service.

Information from the connected ECM database is retrieved and available on the device display. Both the name of the document and the chassis number are mandatory. Michael enters the required information on the device display.

This information is linked to the database. For example, entering the first three digits of the chassis number is enough to get a list of search results from which to select the appropriate chassis number. Next, from a list of predetermined destinations, the correct document destination is selected. A connection is established, and the document is then sent to the correct location in the ECM system.

With the touch of a button, the Drivve | Image solution automatically performs image cleaning during the scanning process and transmits the documents as easily readable and searchable PDFs to the car dealership's ECM system. The data is also sent to those responsible for further processing, such as the service area responsible for processing the new car before handing it over to the new owner.

The email addresses required can be selected directly from the display of the multifunction device. Michael is noted as the message sender and he can add custom text with instructions for further processing if necessary. By simply managing and distributing the documents on the multifunction device, Michael saves time. The process of copying the documents and filing them in countless folders becomes redundant. Documents are now available to all employees centrally and digitally from the ECM system.
