# LRS Enhances Printing for GE Healthcare Centricity Applications

LRS Provides a Common Output Platform for GEHC Centricity and Other Critical Applications

Features to lower costs of Output Management from Centricity applications:

- Eliminate the requirement to build separate O/S print queues for page orientation

- Retain, reprint, redirect and divert print jobs without regenerating the output at the application level

- Assure delivery, even draw from specific trays, and provide external event notification in the event of job failures

- Potentially eliminate dedicated print servers, and consolidate Open Systems application output to a single architecture for printing, viewing, archiving, faxing and/or emailing.

- Take advantage of MFD and third party security devices

- Minimize down time during O/S changes or application upgrades

Customer benefits:

- Eliminate printing and manual distribution of reports by emailing document links, archiving and/or viewing

- Assure a job is printed with automatic divert if primary printer fails

- Reduce administration time by lowering the number of queues per physical device

- Increase Help Desk print issue resolution up to over 90% on the first call

- Functional for OpenVMS and AIX

Queue (×12)

GEHC Before LRS Solution

- Multiple O/S Queues
- No audit ability to track print job delivery
- Multiple printer definitions and points of failure
- O/S printer administration support dedicated by application
- Adding, moving or changing printers requires hours/days and UNIX and Windows administration
